

ResNet
solved the problem of vanishing gradients.

The core of Resnet is Residual block. It add a skip connection on
basic neuronal network.

The problems solved by ResNet:
When the network is too deep, the gradients cannot be passed back, and the previous layers cannot learn anything, resulting in the fact that deep networks perform worse than shallow networks. ResNet solves this problem by adding a "skip connection" (a shortcut), allowing the gradients and signals to bypass the intermediate layers and pass back directly, thus enabling extremely deep networks to be trained normally.
